1 If i understood it well, the intermediate consumption in the budgetary documents is available on an aggregate basis. As details are not available we need to conduct surveys among the main ministries and departments to collect product level data.

Yes, in many cases the data on intermediate consumption will be aggregated and thus small surveys need to be conducted among main ministries and departments to collect product level data.

2. What need to be done if the external balance of goods and services from the BOP is different from that obtained using the SUT framework?

In this case the Statistics Office needs to discuss the reasons for the differences with the Central Bank. The numbers to be published by the Statistics Office should fully reconcile with the numbers published by the central Bank. Remember there are some conceptual differences between the BOP and imports and exports of goods data compiled by Statistics Office or Customs Authorities. Imports of goods are valued at CIF whereas in the BOP they are valued FOB. In addition the BOP may adjust certain numbers due to coverage such as goods procured in the port, purchases by resident and nonresidents abroad or in the economy.
