

# A FRAMEWORK FOR DIGITAL SUPPLY – USE TABLES

Conceptual description

John Mitchell (OECD)  
Thematic webinar  
November 17 2021

## Digital Supply – Use Tables (SUTs)

1. The need for Digital SUTs.
2. The conceptual framework
3. Future steps for compilation of the Digital SUTs.
4. Practical implementation of the digital SUTs

# The need for digital SUTs

## Is this what everyone thinks?

*“These days it seems that a growing fraction of innovation is not measured at all. In a world where houses are Airbnb hotels and private cars are Uber taxis, where a free software upgrade renews old computers, and Facebook and YouTube bring hours of daily entertainment to hundreds of millions at no price at all, **many suspect GDP is becoming an ever more misleading measure.**”*

The Economist Apr 30th 2016

# Where is the digital economy in macroeconomic statistics?

Digital transformation is **largely hidden in the core economic accounts** and challenges our conceptual frameworks and measurement approaches.

- **Production chains** between producer and consumer **are changing**, while the overall value add may remain the same, the current frameworks struggle to show the “winners” and “losers”.
- Digitalisation can remove players (direct online booking) or add additional players (intermediary platforms).
- Statistical recording of the production and use of data, including **the ‘participative’ production of consumers**, digitalisation blurs the boundaries between produced and non produced.
- The “free / zero cost” services provided by private companies, **how and what to measure?**
- Confusion over what is **Production vs. Consumer Surplus**

# BASICS OF SUPPLY-USE

# Supply- Use Tables (Basic Introduction)

- Outlined in Chapter 14 of SNA2008.
- Usually **used for annual benchmarking** when additional high quality, but irregular, data sources are combined. Quarterly estimates are usually indicators that move these estimates forward.

## **Domestic output + Imports = Final demand + Exports**

- This works on **both an industry and product basis**, all products produced must be used, and all final demand/exports must come from an industries production/import

- Output +
- Imports +
- Trade and transport margins +
- Taxes less subsidies on products

- Intermediate consumption +
- Final consumption +
- Capital formation +
- Exports.

# Supply- Use Tables (Basic Introduction)

Usually shown as two matrices; a supply table and a use table

- **Industry in the columns**
- **Products in the rows**

Products	INDUSTRIES	IND. A	IND. B	IND. C	IND. D	IND. E	Total
Product 1		50					50
Product 2			60				60
Product 3				45	15		60
Product 4			10		50		60
Product 5						65	65

# The framework for Digital SUTs

## Background on the work

---

- Developed by the OECD **Informal Advisory Group** on Measuring GDP in a Digitalised Economy.
- The advisory group was created under the OECD Working Party on National Accounts (WPNA) to **advance the measurement agenda** in the area of digitalisation.
- The work has evolved into the **guidance note** from the NA Advisory Expert Group digitalisation sub-group recently sent for **global consultation**
- The advisory group will continue to meet in order to **progress the compilation** of digital SUTs. New members are always welcome!
- A **handbook** on compilation of digital SUTs **is planned for release in 2022**

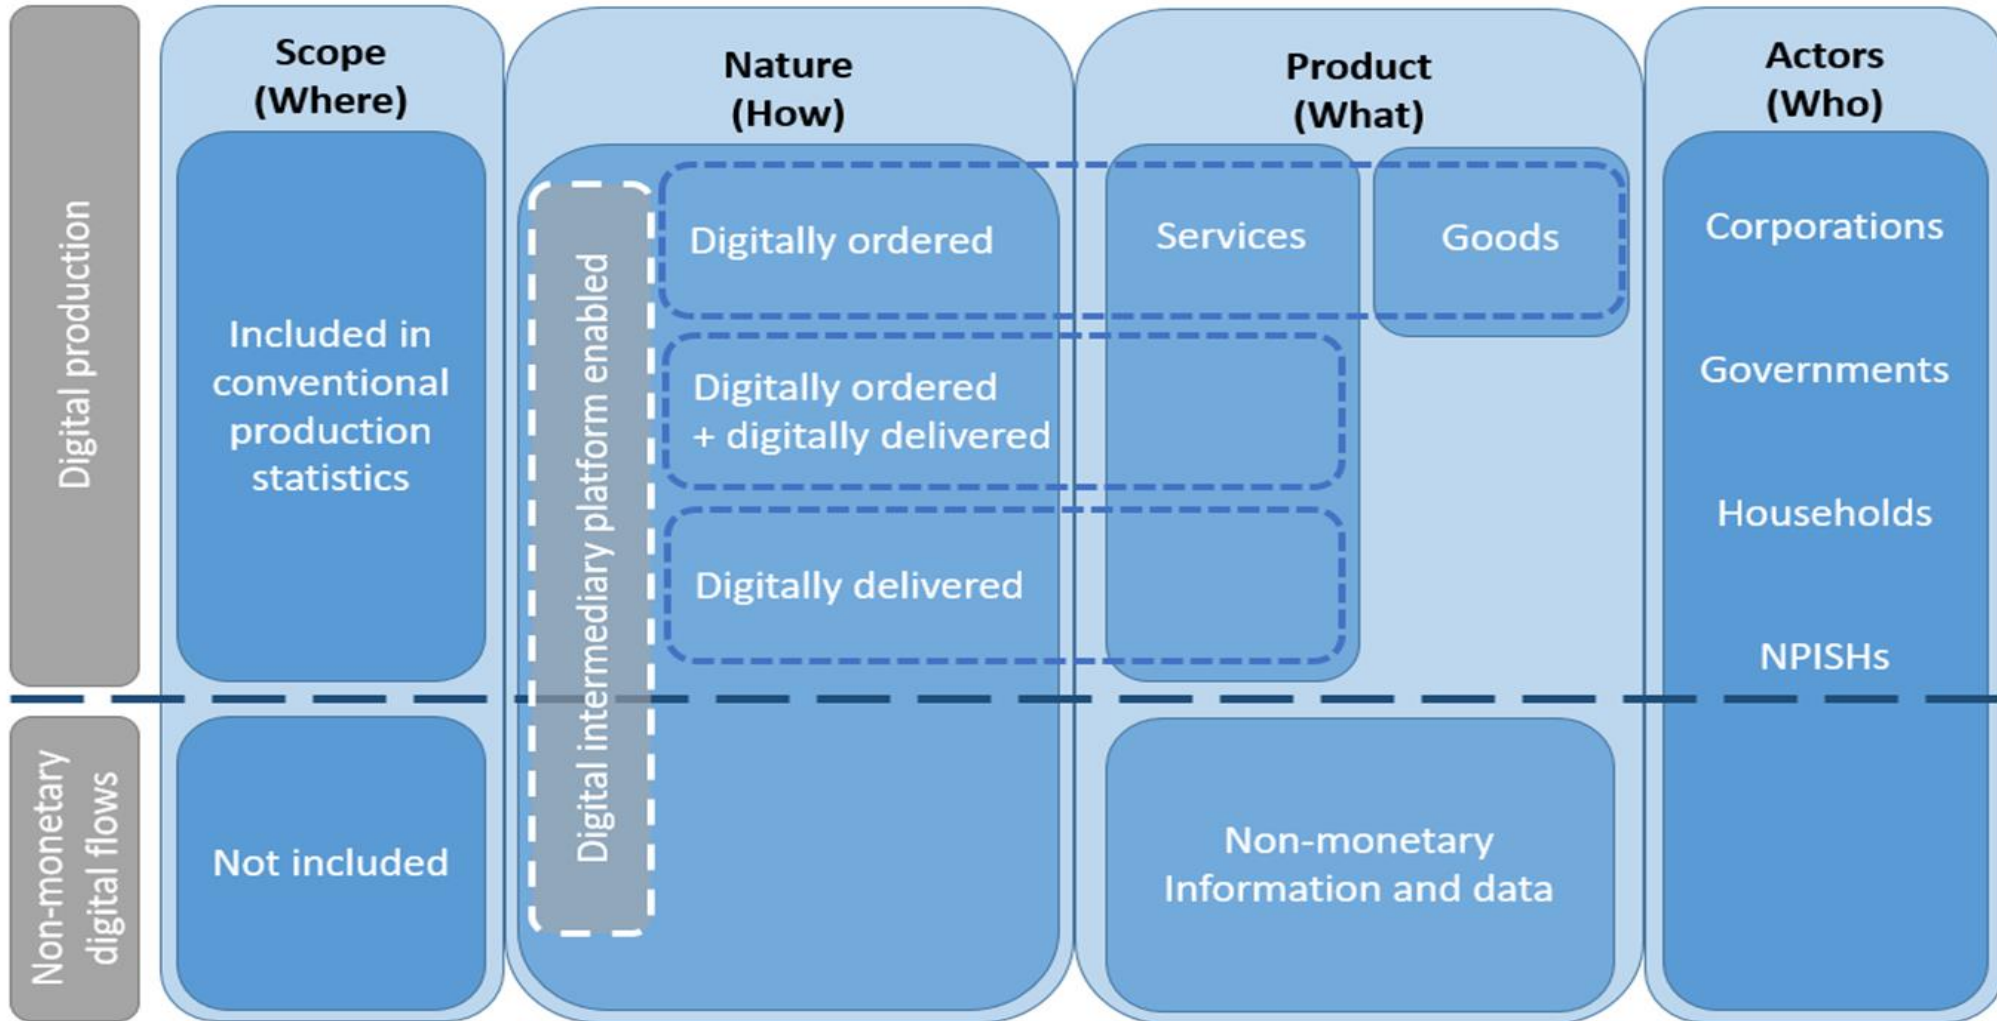

## The aim of the Digital SUTs

---

- To reassure users that the national accounts includes production heavily impacted by digitalisation.
- To **come up with many numbers** that provides more information to users and policy makers.
- **Not to come up with a single number** for the digital economy.

# Framework for Digital SUTs

# Digital Supply-Use tables framework

---

- The framework **includes the following extensions** to the conventional supply-use tables:
  - Additional rows, under each product, separating the **different transactions types**.
  - Additional **digital product aggregations** and lower level products to assist in answering specific user questions.
  - Additional product rows representing **products currently outside of the core SNA**.
  - Additional columns to represent the **new digital industries**, units are aggregated based on their shared characteristics.
  - Additional columns allowing for the representation of services that have been **digitally delivered**.

# Transactions

- The split in transactions is a significant change to the template (Example below), **allows for all products to be considered as digital.**

Accommodation services		
a	Digitally ordered	
a_i	Direct from a counterparty	
a_ii	Via a resident digital intermediary platform	
a_iii	Via a non-resident digital intermediary platform	
b	Not Digitally ordered	

- Currently this kind of split would be requested only for **aggregates, digital products,** and **products that have been heavily impacted by digitalisation** (Accommodation, food service, education).

# Products

- Digital SUTs have **additional product aggregations** and lower level products to assist in answering specific user questions.
  1. ICT goods - *four types of goods included in the alternative classification of ICT products, as included in the CPC 2.1*
  2. Digital services – *all services included the alternative classification of ICT products, as included in the CPC 2.1*
  3. Cloud computing services “Computing services based on a set of computing resources that can be accessed in a flexible, elastic, on-demand way with low management effort”
  4. Digital intermediary services “the service of providing information on and successfully matching two independent parties to a transaction via a digital platform in return for an explicit fee.”
- They also **include product rows to incorporate products currently outside of the core SNA production boundary.**
  1. Data (beyond 2008 SNA)
  2. Digital services (beyond 2008 SNA), provided by enterprises
  3. Digital services (beyond 2008 SNA), provided by communities

# Industries

- Additional columns to represent the new digital industries.
  - **Digitally enabling industries**
    - Industries engaging in production that is primarily intended to fulfil or enable the function of information processing and communication by electronic means, including transmission and display. (ICT sector)
  - **Digital only firms providing financial and insurance services**
    - Those units providing financial services which are operating exclusively digitally, with no interaction with consumers physically. (E-banks)
  - **Digital intermediary platforms charging a fee (DIPs)**
    - Digital units that, in exchange for a explicit fee, facilitates interactions between two or more distinct but interdependent sets of users (whether firms or individuals) who interact through the service via the Internet. (Uber, Booking.com, AirBnB)
  - **Firms dependent on intermediary platforms**
    - Units for which the majority of demand for their goods and/or services comes via (an) intermediary platform(s). This could range from large international corporations (hotel chains) to small independent contractors (delivery couriers for food orders).

# Industries

- **Data and advertising driven digital platforms**
  - Units operating exclusively online that predominately generate revenue via selling data or advertising space. This is likely to include social media platforms, search engines, knowledge sharing platforms as well as providers of free phone applications. (Google, Instagram, Epic Race 3D)
- **E-Tailers**
  - Includes retailers and wholesalers engaged in purchasing and reselling goods or services who receive a majority of their orders digitally.
- **Other producers only operating digitally**
  - All units operating exclusively digitally that have not been placed in one of the previous industries. It likely includes businesses that produce their own services for sale, but operate exclusively digitally. (Online gaming, Netflix), etc.)
- Units would be reclassified from existing ISIC industry classifications based on these shared characteristics.

# Digitally delivered

- Defined as “*Transactions that are delivered remotely in an electronic format, using computer networks*” (Handbook on Digital Trade).
- The inclusion of the columns ensures aggregates can be identified that align with the **digital SUTs and digital trade** framework.
- Represented in the digital SUTs as additional columns showing additional breakdowns for;
  - **total output,**
  - **total consumption,**
  - **total exports,**
  - **total imports.**

# Outputs of the Digital SUTs

## It provides a suite of indicators on digital activity:

- Total E-commerce in the economy.
- Total expenditure on ICT goods and digital services by conventional industry.
- Total imports and exports of Digital services.
- It does not provide one number as a countries' "digital economy" estimate.

## It provides a location for products outside of the production boundary to be included (i.e. data).

- Currently it does not include a proposed methodology as discussion are still ongoing.

## It does not quantify the contribution of digitalisation to the output of a specific industry

- E.g. it is unable to explicitly measure digitalisations' impact on the production of orange juice.

# Digital Trade

---

- The **digital SUTs align with the digital trade framework.**
- Digital trade is defined as all trade that is: “**digitally ordered and/or digitally delivered.**”
- Version 1 of the OECD-WTO “**Handbook on Measuring Digital Trade**” was made **available in January 2020.**
  - The handbook provides both a **conceptual framework to define digital trade**, as well as a mechanism to share existing national and international efforts on measuring digital trade in order to **identify and develop best practice.**
  - The handbook will be **a living document** responding to developments in measurement methodology, similar to digital SUTs there is an **accompanying template** used to capture estimates.

## Please remember

---

Don't be scared of the framework  
We ask for everything, because we can...  
Just complete what you can

# Future steps for compilation of the Digital SUTs

# Compilation of the framework

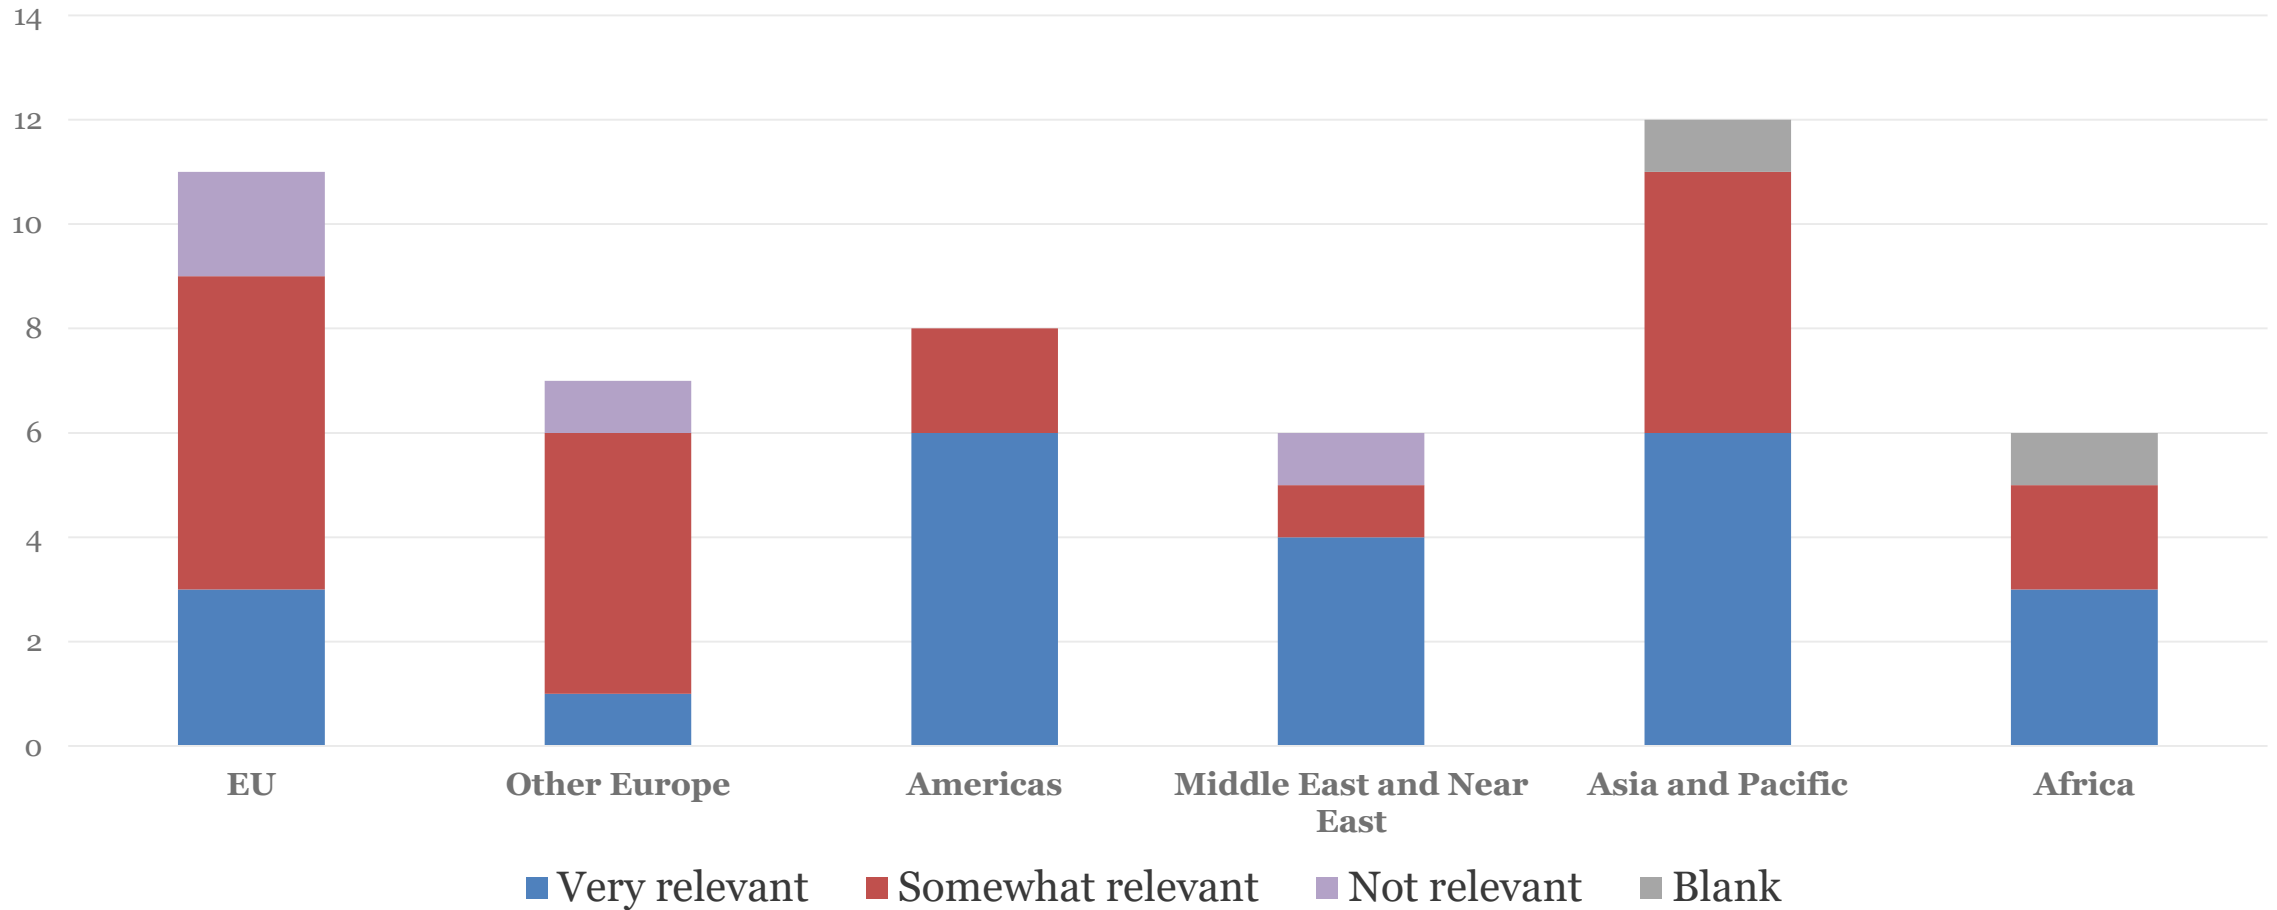

---

Many countries have expressed that they do **not currently have the capability** to produce all estimates in the table.

- The Digital SUTs are partly designed to **act as road maps** that help to motivate **the development of new data sources**.
- Digital SUTs will help to **provide momentum** for all countries in fostering the compilation of **internationally comparable data** on the digital economy.
- Some **initial indicators are being targeted first**.

# Is the construction of digital SUTs relevant for your country?

# High priority indicators

---

The advisory group have generally agreed to target the following high priority indicators;

1. **Output, Gross Value Added** (GVA) and its components, of **digital industries**.
  2. Intermediate consumption of **Digital Intermediary Services** (DIS), **Cloud Computing services** (CCS) and total ICT goods and digital services.
  3. Expenditures **split by nature of the transaction**, includes estimates of digital trade.
- **Provides a wide scope for countries** to begin producing estimates despite the various levels of data sources and resources available across countries.
  - Help in **co-ordinating the initial results** that can be derived from the Digital SUTs.

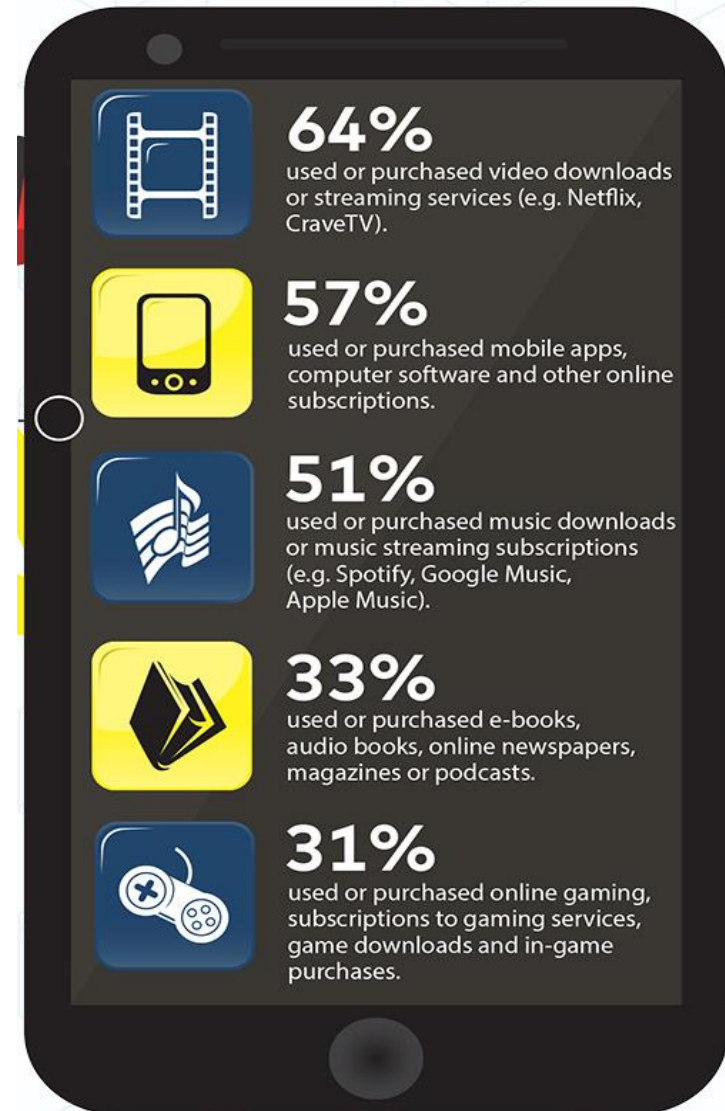

# PRACTICAL STEPS FOR COMPILATION OF DIGITAL SUTS

# Leveraging off household surveys on digital use

- Canada has completed a household digital survey. It covered *“the use and purchase of various digital products, such as music and video streaming services, e-books, mobile apps, and online gaming subscriptions.”*
- Additional modeling is required, however data from this survey can be used to generate estimates of
  - Consumption of digital goods & services
  - Imports of digital services
  - Value added of various digital producers.

# Leveraging off household surveys on digital use

---

- Many countries use business surveys to delineate how much has been purchased online/digitally
  - **Goods and services bought/ordered via the Internet**, Sweden
  - **Retail Trade, online sales**, Australia
  - **Internet sales as a percentage of total retail sales**, UK
- These can be used as indicators to break up established estimates in the standard Supply-Use Tables. (i.e. for telecommunications, retail)

# Modelling based on one specific digital platform

- Work by **NZ and NLD** focus on a particular product (**accommodation services**) that has been disrupted by intermediary platforms
- Estimates of production and household consumption of this specific product data were derived by gathering data from a variety of sources, including; **media and academic articles, web scraping** as well as taken sourced **directly from the platform provider.**

Total adjustment to gross output to account for accommodation-sharing, year ended March 2013–18

# Modelling based on purchased and scavenged data

- Bundesbank has used **publically available and purchased data** to model estimates of consumption and imports of digital services (music, apps, gambling etc.).
- The work included data taken from *AppAnnie*, *Statista* and *bitkom* and included in their core national accounts

€ Mill	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
<b>Apps</b>	11	65	171	308	392	659	929	1,048	1,067	1,139
